# Recap

```
DMU
    - Probabilistic Models
- MDPs
- Reinforcement Learning
- POMDPs
- Games
```

### **Probabilistic Models**

# P(A) P(A,B) P(AIB)

#### 3 Rules

1. 
$$0 \le P(X \mid Y) \le 1$$

$$\sum_{x \in X} P(x \mid Y) = 1$$

2. 
$$P(X) = \sum_{y \in Y} P(X, y)$$

3. 
$$P(X \mid Y) = \frac{P(X,Y)}{P(Y)}$$

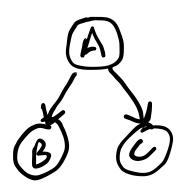

#### **Bayes Rule**

$$P(A \mid B) = \frac{P(B \mid A)P(A)}{P(B)}$$

#### **Independence**

$$A \perp B \iff P(A,B) = P(A)P(B)$$
 
$$A \perp B \mid C \iff P(A,B \mid C) = P(A \mid C)P(B \mid C)$$

### **Bayesian Networks**

#### **Chain Rule**

$$P(X_{1:n}) = \prod_i P(X_i \mid Pa(X_i))$$

#### **Conditional Independence**

 $X \perp Y \mid \mathcal{C}$  if all paths between X and Y are d-separated by  $\mathcal{C}$ 

### **Markov Decision Processes**

$$(S, A, R, T, \gamma)$$

Examples: 
$$S=\{1,2,3\}$$
 or  $S=\mathbb{R}^2$ 

$$s=(x,\dot{x})\in S=\mathbb{R}^2$$

$$V^{\pi}(5) = Q^{\pi}(5,\pi(5))$$

$$V^\pi(s) = R(s,a) + \gamma E[V^\pi(s')]$$

**Policy Evaluation** 

$$V^*(s) = \max_a \left\{ R(s,a) + \gamma E[V^*(s')] 
ight\}$$

Bellman's Equation: Certificate of Optimality

$$B[V](s) = \max_a \left\{ R(s,a) + \gamma E[V(s')] 
ight\}$$

Bellman's Operator

### Offline MDP Algorithms

#### **Policy Iteration**

**Value Iteration** 

loop

**Evaluate Policy** 

Improve Policy

loop

$$V \leftarrow B[V]$$

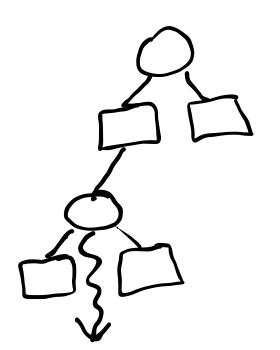

Converges because policy always improves and there are a finite number of policies

Converges because B is a contraction mapping

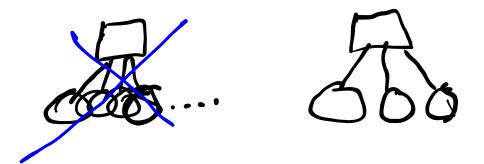

## Online MDP Planning

#### **Monte Carlo Tree Search**

Search Expand Rollout Backup

#### **Sparse Sampling**

Guarantees *independent* of |S|!!

### LQR

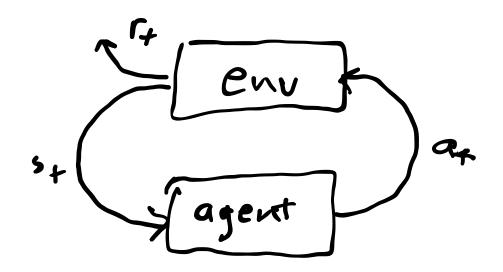

$$s' = T_s s + T_a a + w$$

$$R(\mathbf{s}, \mathbf{a}) = \mathbf{s}^{\top} \mathbf{R}_{s} \mathbf{s} + \mathbf{a}^{\top} \mathbf{R}_{a} \mathbf{a}$$

$$\pi_h(\mathbf{s}) = -\left(\mathbf{T}_a^{\top}\mathbf{V}_{h-1}\mathbf{T}_a + \mathbf{R}_a\right)^{-1}\mathbf{T}_a^{\top}\mathbf{V}_{h-1}\mathbf{T}_s\mathbf{s}$$

$$\mathbf{V}_{h+1} = \mathbf{R}_s + \mathbf{T}_s^{\top} \mathbf{V}_h^{\top} \mathbf{T}_s - \left( \mathbf{T}_a^{\top} \mathbf{V}_h \mathbf{T}_s \right)^{\top} \left( \mathbf{R}_a + \mathbf{T}_a^{\top} \mathbf{V}_h \mathbf{T}_a \right)^{-1} \left( \mathbf{T}_a^{\top} \mathbf{V}_h \mathbf{T}_s \right)^{-1}$$

## Reinforcement Learning

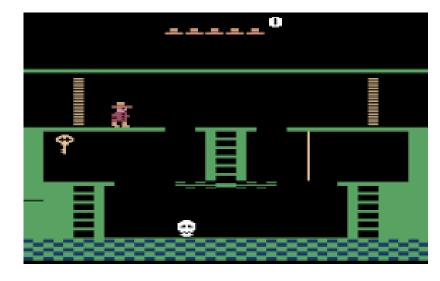

#### Challenges:

- 1. Exploration and Exploitation
- 2. Credit Assignment
- 3. Generalization

### **Exploration**

#### **Bandits**

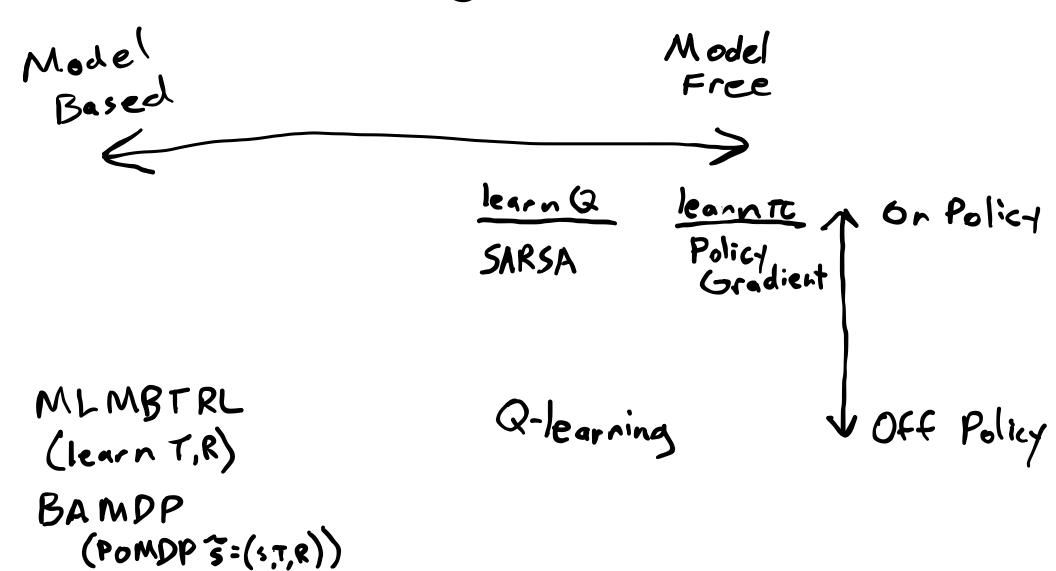

- $\epsilon$ -greedy
- softmax
- UCB
- Thompson Sampling
- Optimal DP Solution (solving a POMDP!)

Montezuma's Revenge!

- Pseudocounts
- Curiosity: extra reward for bad prediction
- Random network distillation

### **RL Algorithms**

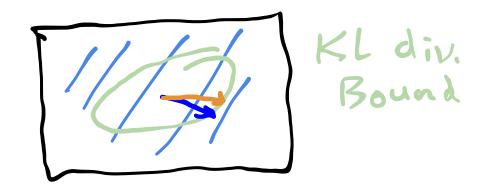

## **Policy Gradient**

- Likelihood ratio trick
- Causality
- Baseline Subtraction

$$\nabla_{\theta} p_{\theta}(\tau) = p_{\theta}(\tau) \nabla_{\theta} \log p_{\theta}(\tau)$$

$$\nabla U(\mathbf{\theta}) = \mathbb{E}_{\tau} \left[ \sum_{k=1}^{d} \nabla_{\mathbf{\theta}} \log \pi_{\mathbf{\theta}}(a^{(k)} \mid s^{(k)}) \gamma^{k-1} \left( r_{\text{to-go}}^{(k)} - r_{\text{base}}(s^{(k)}) \right) \right]$$

• Natural Gradient

### **Q-Learning**

#### **SARSA**

$$Q(s,a) \leftarrow Q(s,a) + \alpha(r_t + \gamma Q(s',a') - Q(s,a))$$

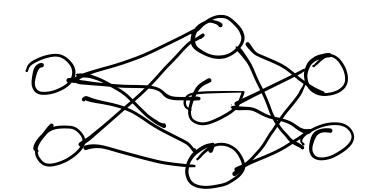

**Eligibility Traces** 

#### **Q-learning**

$$Q(s,a) \leftarrow Q(s,a) + lpha(r_t + \gamma \max_{a'} Q(s',a') - Q(s,a))$$

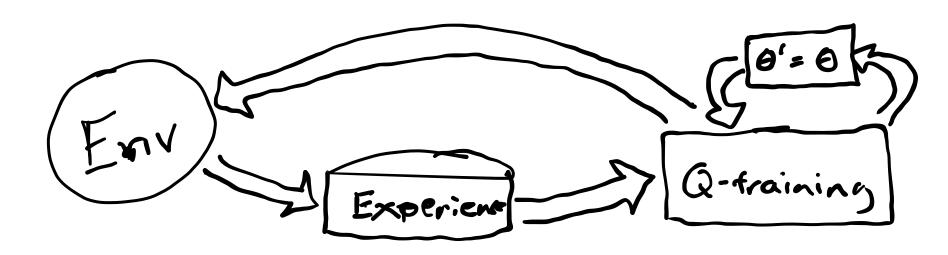

Double Q Learning

### Neural Networks and DQN

$$f_{ heta}(x) = \sigma(W_2\sigma(W_1x+b_1)+b_2)$$

Backprop

### **Actor-Critic**

• Actor:  $\pi_{\theta}$ 

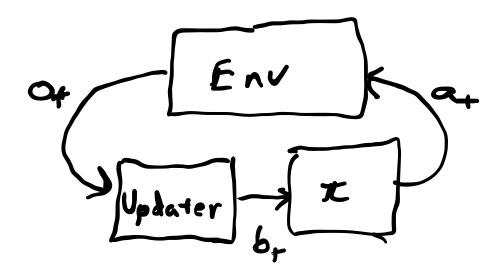

• Critic:  $Q_{\phi}$ 

#### **Soft Actor Critic**

$$J(\pi) = E\left[\sum_{t=0}^{\infty} \gamma^t \left(r_t + lpha \mathcal{H}(\pi(\cdot \mid s_t))
ight)
ight]$$

### **POMDPs**

 $(S, A, T, R, O, Z, \gamma)$ 

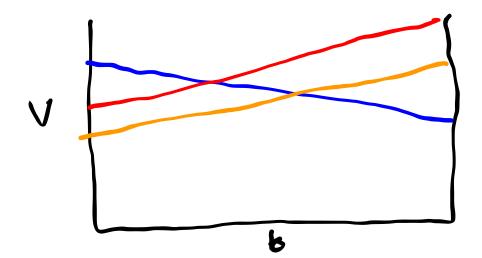

- Each alpha vector corresponds to a conditional plan
- You can prune alpha vectors by solving an LP

#### **Belief Updates**

- Discrete Bayesian Filter
- Particle Filter

#### **Alpha Vectors**

## **POMDP Approximations**

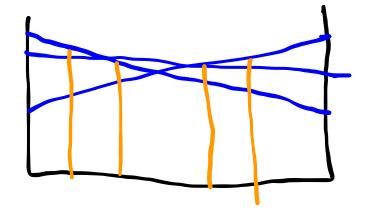

#### **Formulation**

- Certainty Equivalence
- QMDP

#### **Numerical**

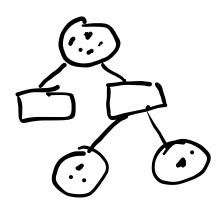

#### Offline

- Point-Based Value Iteration
- SARSOP

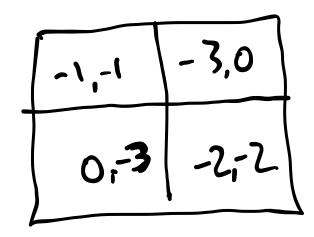

#### **Online**

- POMCP
- DESPOT

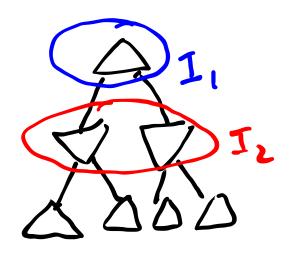

### Simple Games

- Optimal Solutions
- Equilibria (e.g. Nash Equilibria)

- Every finite game has at least 1 Nash Equilibrium
- Might be pure or mixed
- Algorithms like fictitious play converge in special cases

### **Turn Taking Games**

- Value Function Backup
- $\alpha\beta$  Pruning
- Incomplete Information Extensive Form

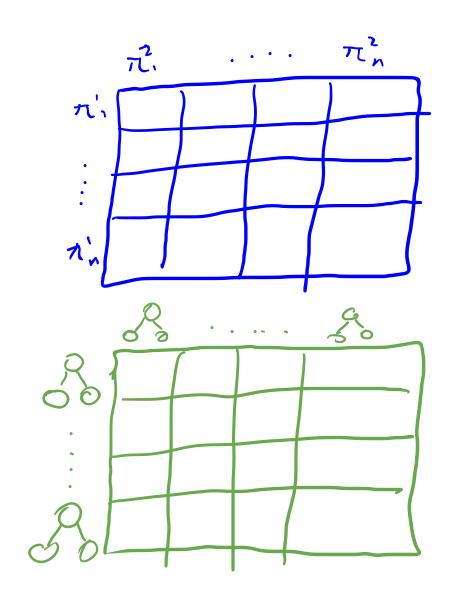

### **Markov Games and POMGS**

#### **Markov Games**

- All players play simultaneously
- Transitions are stochastic
- Best response involves solving an MDP
- Can be reduced to a simple game with policies as actions

#### **Partially Observable Markov Games**

- Each player receives a noisy observation at each step
- Beliefs not practical to compute
- Can be reduced to simple game with policies as actions

## Fictitious Play in Markov Games

### Recap

# After DMU you have basic tools to deal with 4 Big Problems:

- 1. Immediate and Future Rewards
- 2. Unknown Models
- 3. Partial Observability
- 4. Other Agents
